

Care instructions for lustrous mineral cast

How to clean mineral cast?

Clean lustrous mineral cast with a commercially available (non-abrasive) cleaning agent, in a circular motion. Then dry the surface with a soft cloth.

Do not allow coloring agents, such as mascara or hair dyes to get in contact with the surface.

What detergents should be used?

To keep the surface lustrous, we recommend household cleaners such as Pril, Ajax glass cleaner, Frosch vinegar and citrus cleaner.

The use of aggressive cleaning agents should be avoided.

How to remove scratches?

Light scratches can be removed with commercially available car polishes. For long-lasting shines, it is worthwhile to rub the washbasin from time to time with car polish, and to polish it immediately.

Can mineral casts be repaired?

If an accident occurs like a scratch or a discoloration by an aggressive chemical substance, this can usually be repaired by our customer service.

Is the mineral cast heat-resistant?

Yes, up to 65°C. In alternation with cold water, hotter water can cause damages to the material.
