

## Care instructions for matt mineral cast

### How to clean mineral cast?

Clean the matt mineral cast with **abrasive detergents, in a circular motion!** For this purpose, use any commercially available scouring milk and a damp cloth. The matt surface is thus retained. Clean the surface with a wet cloth and then wipe it dry.

Do not allow coloring agents, such as mascaras or hair dyes, to get in contact with the surface.

### What detergents should be used?

We recommend commercially available abrasive household cleaners such as CIF, Squib or Viss-Scouring milk. The use of aggressive cleaning agents should be avoided.

### How to remove stubborn stains or scratches?

Use a wet scouring sponge, for example a white Scotch-Brite sponge. Wipe with some bleach in a strong circular movements over the stain or the slight scratches and then over the entire washbasin. Then, clean the entire surface with scouring milk, as described above to obtain an evenly matted surface.

### Can mineral cast be repaired?

If a misfortune happens like a big scratch or a discoloration by an aggressive chemical substance, this can be repaired by our repair service in most cases.

### Is mineral cast heat-resistant?

Yes, up to 65°C. In alternation with cold water, hotter water can cause damages to the material.
